

$$C_p (\text{s h}_2\text{o}) = 0.5 \text{ cal/g}^\circ\text{C}$$

$$H_{f(\text{water})} = 80 \text{ cal}$$

$$C_p (\text{l h}_2\text{o}) = 1 \text{ cal/g}^\circ\text{C}$$

$$C_p (\text{g h}_2\text{o}) = 0.5 \text{ cal/g}^\circ\text{C}$$

$$H_{v(\text{water})} = 540 \text{ cal}$$

***Copy down and work the following problems. You may do the math for 1 gram and then multiply the answer by the total grams at the end.***

- 1) How many calories are needed to raise the temp. of 20g of ice at  $-10^\circ$  to the melting point?
- 2) How many calories are needed to raise the temperature of 5g of water at  $30^\circ\text{C}$  up to  $100^\circ\text{C}$ ?
- 3) How many calories are needed to boil 15g of water to steam?
- 4) How many calories are needed to heat 50g of water from  $-4^\circ\text{C}$  up to  $104^\circ\text{C}$ ?
- 5) How many calories are released from the condensation of 100g of steam at  $102^\circ\text{C}$  down to water at  $90^\circ\text{C}$ ? (think about this)
- 6) If the  $C_p$  of copper is  $0.092 \text{ cal/g}^\circ\text{C}$ , how many calories are needed to raise the temp of 10g from  $40^\circ$  to  $55^\circ$ ?
