

SQUIRREL HABITATS

What is a safe squirrel habitat? Do the Coolkit Leaping Squirrel Test. Squirrels are known to live way up high in a tree's canopy where it is safest for them. On average a squirrel can jump about 2 meters (6 feet) from one tree on the next.

Can the squirrel on your city block leap from tree to tree without running along the ground? Contemplate your urban forest in Saskatoon.

A safe squirrel canopy is also a safe canopy for us. Why? Are there enough trees on your city block?

Did you know you can order free trees from the City of Saskatoon to plant in your yard?

How do you help trees survive years of drought?

Do you change your habits to help the environment?

1. Are you a vegetarian? It takes 18 times more land to feed cows than humans. Did you know they cut down rainforests - the home to many species at risk and a major source of the earth's oxygen - to grow soyabeans for cattle feed pellets?
2. Do you use bicycles, carshares, transit, or electric vehicles?
3. Do you grow your own food, to take climate action on shipping and transport of food?
4. How do roads and sidewalks affect the environment? How do they affect the climate?
5. Did you know that these 474 acres of Saskatoon Afforestation Areas were part of a larger afforestation area plan? Have you written to your councilor asking for more afforestation areas?
6. Do you, personally, plant ten trees every year?
